

Use case name	Assign Employee to Shift
Textual Description	The manager assigns an employee to an existing shift according to the employee's role, availability, and the shift requirements.
List of Actors	Manager
Pre-conditions	The employee exists in the system. The shift exists in the system. The employee has a role that is required for the shift.
Post-conditions	The employee is assigned to the selected shift with the selected role.
Main success scenario	1. The manager selects the option to assign an employee to a shift. 2. The system asks the manager to enter the shift day and shift type. 3. The manager enters the shift day and shift type. 4. The system displays the selected shift details and available assignment options. 5. The system asks the manager to enter the employee ID. 6. The manager enters the employee ID. 7. The system displays the employee details and the available roles for the shift. 8. The manager selects the employee's role in the shift. 9. The system assigns the employee to the selected shift. 10. The system displays a confirmation message.
Alternatives	3a. Invalid shift details: 1. The system displays an error message. 2. The manager enters valid shift details. 3. The use case continues from step 4. 4a. Shift does not exist: 1. The system displays a "Shift not found" message. 2. The use case ends. 6a. Employee does not exist: 1. The system displays an "Employee not found" message.

	2. The use case ends. 8a. The selected role does not exist or is not required for the shift: 1. The system displays an error message. 2. The manager selects another role or cancels the assignment. 8b. The employee is not qualified for the selected role: 1. The system displays an “Employee is not qualified for this role” message. 2. The manager selects another employee or another role. 8c. The employee is not available for the selected shift: 1. The system displays a warning message. 2. The manager chooses whether to override the availability constraint. 3. If the manager approves the override, the use case continues from step 9. 4. If the manager does not approve the override, the use case ends. 9a. The shift is full: 1. The system displays a “Shift is full” message. 2. The use case ends. 9b. The shift does not have a shift manager: 1. The system displays a message that a shift manager is required. 2. The manager assigns a certified shift manager first. 3. The use case continues from step 9.
